ABSTRACT

OXYGEN REMOVAL OPERATION IN PILOT SCALE PRODUCTION OF COCONUT WATER BASED ISOTONIC DRINK

Tutun Nugraha, Ph.D., Thesis Co-advisor

Low temperature deoxygenation process is investigated to acquire the critical parameters that can be used in the upscaling process. Process is expected to be able to produce coconut water with dissolved oxygen concentration below 5 ppm while maintaining the original organoleptic properties of coconut water. The research was done by first investigating and constructing a pilot-scale deoxygenator unit followed by experiments using coconut water. The experiments was performed to find the effect of residence time and sparging gas flow rate to level of dissolved oxygen in the product. The deoxygenator unit is designed to work with a packed column using 25.4 mm glass spheres as the packing material and a water pump to induce vacuum. The product will reach stability at 1.05 ppm after approximately 90 seconds. From the data, a mathematical model for scale-up of this particular deoxygenator design was also acquired in terms of oxygen removal ratio as a function of mass transfer coefficient, volume-to-surface area ratio, initial oxygen concentration, nitrogen flow rate, and pressure inside the tank.

DEDICATION

I dedicate this thesis to my family, my advisor and co-advisor, and all my friends who have kept their faith in me during the nadir in my life within the period of this thesis research, and especially for those that kept on cheering me up, urging me to stay focused and move forward in life.

ACKNOWLEDGMENTS

The author would like to thank Mr. Irvan Kartawiria and Mr. Tutun Nugraha greatly as the advisor and co-advisor for this thesis. This thesis would not have been possible without their guidance.

The author also would like to thank the following parties for their support during the author's work on this thesis, in no particular order:

1. Mr. and Mrs. Santosa, for being awesome parents that continually lends their support in form of technical, engineering and management insight, and monetary supply.
2. Mr. Brian Fu Tjung, for starting (and inspiring) the work on coconut water deoxygenation.
3. Mr. Dede Saputra, for providing assistance with the much-used DO meter.
4. Mr. Tabligh Permana, for his continuous support in finding random piece of laboratory equipment that the author requires.
5. The class of PE'08, for being awesome juniors and assistants during the thesis research period.
6. Mr. A. Muzi Marpaung, for giving an insight into the world of sensory analysis and statistical analysis.
